Total likes 1,093 OBSERVED	Estimated authentic likes 557 ESTIMATED (95%: 515–600)	Estimated suspicious likes 536 ESTIMATED (95%: 493–578)
Suspicious likes % 49.0% ESTIMATED (95%: 45–53%)	Authentic likes % 51.0% ESTIMATED (95%: 47–55%)	

- 24% — Abnormal following ratio (present in 50% of sample)
- 20% — Mass-follow pattern (present in 49% of sample)
- 15% — Near-empty profile (present in 40% of sample)
- 9% — New account, high following (present in 43% of sample)
- 9% — No profile picture (present in 32% of sample)
- 9% — Low activity combination (present in 25% of sample)
- 6% — Username anomaly (present in 49% of sample)
- 4% — No biography (present in 46% of sample)
- 2% — Very few posts (present in 11% of sample)
- 2% — Inactivity signals (present in 5% of sample)

Why this like estimate?

196 of 400 sampled likers show suspicious signals (score > 25), scaled to 1,093 likes with a 95% interval.

- Abnormal following ratio (24%): 50% of sampled likers
- Mass-follow pattern (20%): 49% of sampled likers
- Near-empty profile (15%): 40% of sampled likers
- New account, high following (9%): 43% of sampled likers
- No profile picture (9%): 32% of sampled likers

Comments

Total comments 27 OBSERVED	Estimated authentic comments 13 ESTIMATED (95%: 8–18)	Estimated suspicious comments 14 ESTIMATED (95%: 9–19)

ESTIMATED

Duplicate text groups

- “Great content!! Check my profile” ×4 from 4 accounts
- “Nice pic” ×3 from 3 accounts
- “ok this is art” ×2 from 2 accounts
- “love the vibe here” ×2 from 2 accounts
- “Nice post” ×2 from 2 accounts
- “nice” ×2 from 2 accounts
- “Need this on Spotify asap” ×2 from 2 accounts

1 temporal burst(s) detected.

Comment signals

- 44% — Identical text from multiple accounts (present in 63% of sample)
- 19% — Commenter profile looks suspicious (present in 52% of sample)
- 18% — Posted inside a temporal burst (present in 52% of sample)
- 10% — Spam / promotional pattern (present in 26% of sample)
- 5% — Generic stock phrase (present in 26% of sample)
- 1% — Mass mentions (present in 4% of sample)
- 1% — Repetitive emoji pattern (present in 4% of sample)
- 1% — Low-entropy / repetitive text (present in 4% of sample)

Why this comment score?

14 of 27 sampled comments scored > 40 on the suspicion model (52%). 7 duplicate group(s), 1 temporal burst(s), commenter profiles evaluated.

- Identical text from multiple accounts (44%): 63% of sampled comments
- Commenter profile looks suspicious (19%): 52% of sampled comments
- Posted inside a temporal burst (18%): 52% of sampled comments
- Spam / promotional pattern (10%): 26% of sampled comments
- Generic stock phrase (5%): 26% of sampled comments
- Mass mentions (1%): 4% of sampled comments

Disclaimers

- All authenticity figures are ESTIMATES derived from detected signals, not verified facts.
- No single signal classifies an account as a bot; scores combine multiple weighted features.
- Estimates from small samples carry wide intervals and are labelled LOW confidence.
- Only data legitimately available from the active provider or user-supplied datasets is analyzed.
- Like/comment authenticity is estimated from account samples; totals are scaled with 95% intervals.
